

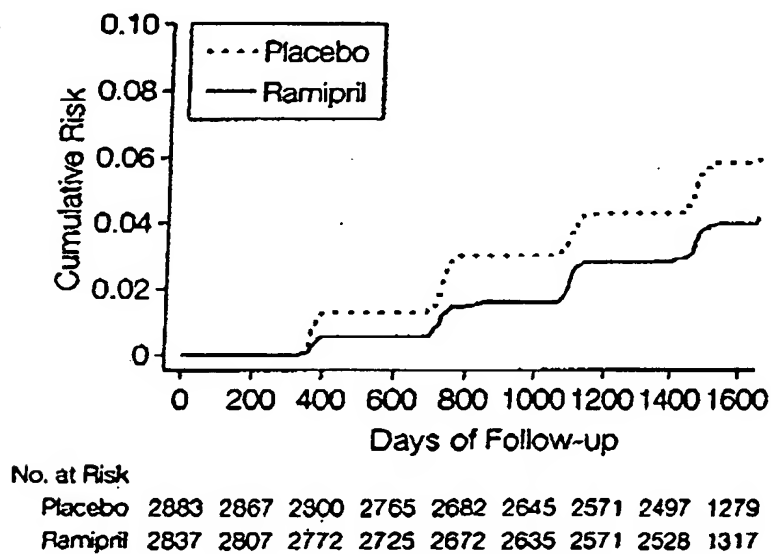

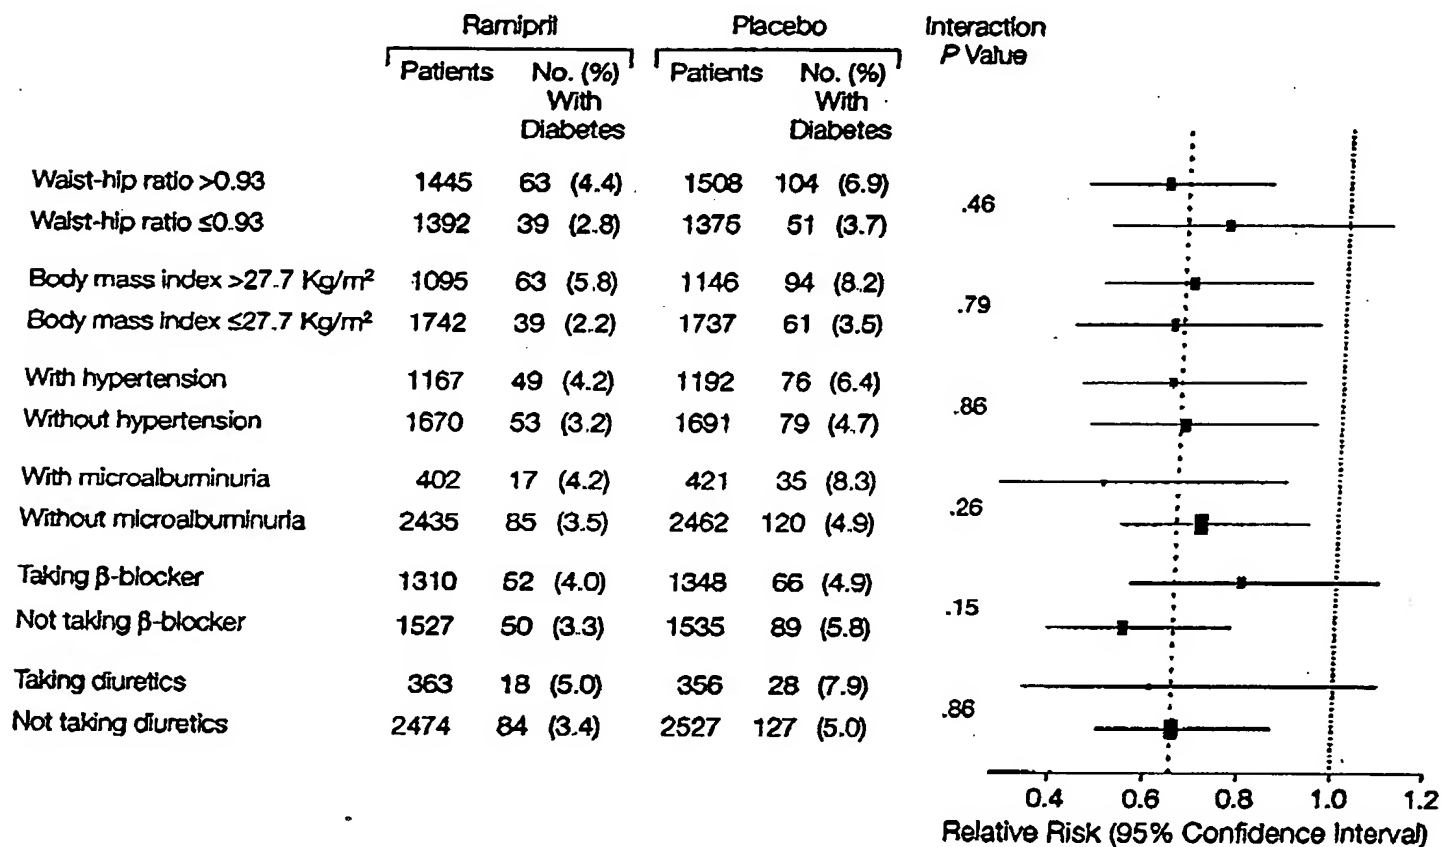

**Figure 1. Development of Diabetes:
Ramipril vs Placebo**

The relative risk for developing diabetes among patients taking ramipril vs placebo is 0.66 (95% confidence interval, 0.51-0.85; $P < .001$).

Figure 2. Effect of Ramipril in Preventing Diabetes in Subgroups Defined at Randomization

Waist-hip ratio and body mass index are subdivided above and below the median. The size of the boxes are proportionate to the number of patients. Dashed line indicates the average treatment effect; dotted line, relative risk equal to 1.
